                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A cDNA clone (AAT34277) codes for human manganese superoxide dismutase (MnSOD) (AAW00018), an enzyme that catalyses the reduction of superoxide radicals to H2O2 and 02. It was isolated from a human T - cell library cloned into vector gt10 using probes (see also AAT34283- 84) based on portions of mature MnSOD. The MnSOD gene was also identified (see also AAT34278-82). The cDNA can be used for the prodn. of recombinant MnSOD using e.g. Escherichia coli cells as hosts. The MnSOD is useful for reducing reperfusion injury, treating inflammation or bronchial pulmonary dysplasia and for prolonging survival of excised organs. This cDNA sequence codes for human manganese superoxide dismutase (hMmSDD, see AAW98169). Novel MnSOD proteins having catalytic activity which differs from this natural hMmSOD are claimed. The modified proteins exhibit reduced or no product inhibition, or have greater activity, or both, compared to natural hMmSOD. The modifications involve one or amino cid substitutions within the active site of the enzyme, especially at residues His-26, His-30, Tyr-34, His-74, Gln-143, Asp-159, Trp-161 and His-163 (see also AAW9811-77). Nucleic acids encoding the modified hMmSOD proteins, or cypression vectors in which modified hMmSOD proteins, or promoter (preferably mammalian), can be used to protect a cell line from damage caused by superoxide radicals (claimed). They can also be used to reat subjects suffering from, or at risk of, cytotoxicity caused by superoxide radicals (claimed), he used as antioxidants in the treatment of a variety of disorders, including inflammation (claimed), reperfusion injury following ischemia (claimed), and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                          2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               128
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      167
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            188
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 227

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes a human manganese superoxide dismutase protein (MMn SOD). The specification describes a modified hMn SOD which has a catalytic activity which differs from natural hMn SOD in that it exhibits reduced or no product inhibition compared to natural hMn SOD. The natural hMn SOD is especially modified with one or more substitutions in amino acids 26, 30, 34, 74, 143, 159, 161 and 163. The modified hMn SOD is useful for protecting a cell from damage caused by superoxide radicals and for treating a subject suffering from cytotoxicity caused by superoxide radicals. The protein is useful for treating inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human manganese superoxide dismutase protein useful as antioxidant for treating cytotoxicity caused by superoxide radicals, inflammation and reperfusion injury following ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  600 CTATCTCGCTGCTGTTTGGTCCGTTATCAACTACAAGGAGGCAGAGGCCCGATTGCAGGC 659
This purified cDNA encodes both prepro- and mature-manganese superoxide dismutase (MSOD). It is one strand of a double stranded molecule contained in a recombinant vehicle. The MSOD produced catalyses the reaction of hydrogen ions and the SOD radical anion to form hydrogen peroxide and water. It is useful in veterinary and pharmaceutical compsns. for e.g. reducing lesions of reperfusion following ischaemia, to prolong survival time isolated organs and for treating inflammation. See also ANY1371-72. (Updated on 10-MAR-2003 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the nucleotide sequence of human manganese superoxide dismutase (hSODm) cDNA. The CDNA was isolated from an adult human kidney cDNA library in landa-gtl0 using the probes given in ABN84889-90. The invention relates to methods for hSODm gene cloning and expression in microorganisms, especially Escherichia coli or Saccharomyces cerevisiae. The hSODm cDNA is inserted into a vector for expression in the microbial host, preferably under conditions which allow product is useful for treating a patient having inflammanory joint disease (e.g. osteoarthritis or rheumatoid arthritis), or to minimise post-ischaemic tissue damage resulting from disease or surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparing recombinant human manganese superoxide dismutase, useful in the treatment of osteoarthritis and rheumatoid arthritis.

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Axenic plate culture") and a third library represents axenically grown plants ('FHIG:C') Axenic plate culture'). Libraries were analyzed in parallel and 3555 (FHIG:A), 3964 (FHIG:B), and 2532 (FHIG:C) high-quality (PHRED 20) ESTS of >99bp have been deposited. The CDNA libraries were constructed from total RNA using the SMART CDNA library Construction kit (#K1051-1, Clontech, Palo Alto, CA, USA) according to the manufacturer's instructions. Full-length CDNAs were trimmed by Sfii, fractionated and directionally ligated into (lambda)TriplEx2 arms. The lambda library was converted to a plasmid library via site-specific recombination at loxP sites in a Cre+ strain (E. coli BM25.8). Plasmid clones were randomly collected and analysed by DNA sequencing using a plasmid-specific forward primer (P104).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CF472965 TADS1_12_E11.gl_A015 Drought-stressed loblolly pine roots DS1 Pinus taeda_cDNA clone RTDS1_12_E11_A015 5', mRNA sequence.
